

Every Patient Visit

What is fixed before scheduling begins · what is actually being decided · what falls out of the decision

System / HCHB Clinical order Clinician Patient Scheduler Branch

COLOUR = WHO OWNS THE TRUTH
COUNT = WORKBOOK VARIABLES BEHIND IT

ALREADY IN A SYSTEM

HCHB · Workday · the 485 — a tool can read it today

EVERY ROW BELOW RUNS LEFT TO RIGHT ALONG THIS LINE

HELD BY ONE PERSON

tacit, patient-held — a tool can only ask for it

THE GIVENS

fixed before scheduling begins

CHANGING ONE NEEDS A NEW ORDER, A PAYER DECISION, OR A CHANGE IN THE PATIENT'S LIFE

Regulatory Timing

3 VARS · ALL IN SYSTEM

- SOC OASIS inside 48 hours
- The 5-day recert window
- Missed-visit documentation

Ordered Frequency

3 VARS · IN THE 485

- 2x a week means 2x a week
- Changing it needs a new order
- Compliance window per discipline

MD Orders

3 VARS · ALL HARD

- Wound care every 3 days
- Labs before the MD visit
- Protocol-driven timing

Patient hard constraints

5 VARS · 4 TACIT · 0 IN SYSTEM

- Dialysis · MD appointments
- Caregiver must be present
- Cognitive windows
- Day-of-week constraints

Ordered frequency is an order, not a preference. Seeing a patient fewer times than ordered is a compliance problem, not a scheduling choice.

THE DECISION

the only real degrees of freedom

THIS IS THE WHOLE OF WHAT A SCHEDULER OR A CLINICIAN ACTUALLY CHOOSES

Geography

6 VARS · 4 COMPUTABLE

- Drive time, not distance
- Zip · territory · home base
- Bridges · rivers · crossings

Which clinician

4 VARS

- Discipline / role match
- Specialty competency
- Continuity of care
- Around other disciplines

Which days inside the ordered window

3 VARS

- Spread, not compressed
- Front-load vs the LUPA floor
- Day-by-day balancing

Who first when the week is tight

3 VARS · ALL TACIT

- Who is unstable
- Hospitalisation risk
- Who can safely wait

What time inside the patient's window

5 VARS · 0 IN SYSTEM

- "Can you come after lunch?"
- "Not first thing"
- A preferred time, no reason given

The left of this row is already in a system. The right of it is held by one person and written down nowhere — and it is where the week is actually won or lost.

THE RESULT

derived, not chosen

Productivity

6 OF 8 ALREADY IN SYSTEM

- Points · target · ceiling
- Committed load · pace vs schedule

Productivity is what is left after the givens are obeyed and the decision is made.

It is measured, not selected — which is why pushing on it directly moves nothing. It moves when the decision row gets better information.

Six of its eight variables are already in a system today. The constraint is not the data — it is that nobody sees the trade before the day is built.

WHERE THE DECISION COLLIDES WITH ITSELF — six that happen every week

EACH ONE IS RESOLVED BY ONE PERSON, THE NIGHT BEFORE

Regulatory Timing

SOC OASIS due in 48 hours,
patient is 50 minutes out

Someone drives it, or the
assessment is late. There is no
third option.

The 2pm-only patient breaks
the cluster

The clinician absorbs the drive,
or the patient waits a day.

PT and OT are both ordered
2x a week

Both want the same two days.
Whoever schedules first wins.

The unstable patient takes
90 minutes

Same points as a 40-minute visit.
The clinician simply runs late.

Wound care every 3 days,
caregiver only weekends

Negotiated on the phone, agreed
verbally, written down nowhere.

3x a week ordered, recert
visit lands the same week

The LUPA floor, the order and the
window all bind at once.

TODAY

One clinician resolves all six — the night before,
in their head, written down nowhere

the weekly logic is undocumented and entirely unassisted

THE TOOL

It shows the collision before the day is built, and prices
both sides. The clinician still decides.

release 1 is visualisation only — seeing the trade is the whole of it

NEXT

Each collision becomes an engagement map: a named
owner, a named moment, a named ask

what this sheet exists to carry
