

Plan of Care → Assignment

Reading the sizes. Large blocks happen every time a trigger fires. Small blocks are conditional — they only appear when something is wrong. Pills are watch conditions, not steps: nobody performs a LUPA floor, it is a threshold the episode is measured against. **The two gates are the point of the map.** DCS approval fires once per discipline and the scheduler assignment task fires once per discipline, so four disciplines produce four approvals and four assignment tasks for a care-team decision that could be made once at referral.
